Course/Year/Sec: BSIT 3-B

Individual Activity4: “Design Your Own System Using UML”

PART 1

UML List

1. Use Case Diagram

- A use case diagram shows the users of the system and the actions they can perform. It helps identify the main functions of the system.

2. Activity Diagram

- An activity diagram shows the step-by-step flow of a process in the system. It helps explain how activities are connected from start to end.

3. Class Diagram

- A class diagram shows the structure of the system including classes, attributes, and relationships. It is used for designing the system.

4. Sequence Diagram

- A sequence diagram shows how objects interact with each other in a specific order. It focuses on the flow of messages over time.

System Title

“Smart Canteen Pre-Order System”

Short Description

The Smart Canteen Pre-Order System allows students to view available food items, place orders, and pick up their food at the canteen. The canteen staff can manage food items, confirm orders, and update the order status. This system helps reduce long lines during break time. It also improves order management and communication between students and canteen staff.

Main Features

- | | |
|---------------------|-------------------------------|
| 1. Student login | 4. Staff confirms order |
| 2. View food menu | 5. Staff updates order status |
| 3. Place food order | |

PART 2

1. Use Case Diagram

2. Activity Diagram

PART 3

SDLC Application

Planning

- The system is planned to help students order food faster. It also aims to reduce long lines and improve canteen order management.

Design

- The system design uses UML diagrams to show how the system works. The use case diagram shows the users, while the activity diagram shows the order process.

Implementation

- The system can be developed using HTML, CSS, PHP, and MySQL. These tools can be used to create the interface, process orders, and store data.

Testing

- The system will be tested to check if students can place orders correctly. It will also be tested to make sure staff can confirm and update orders properly.

PART 4

Reflection:

1. What did you learn from creating UML diagrams?

- I learned that UML diagrams help explain how a system works before it is developed. They make it easier to understand the users, processes, and functions of the system.

2. Why is planning important before building a system?

- Planning is important because it helps identify the needed features and process flow of the system. It also helps avoid errors and confusion during development.
